## $\mathbf{L i n e a r} \mathbf{S}_{\text {ystems }}$

Fowler 309 MWF 9:30 am - 10:25 am
http://faculty.oxy.edu/ron/math/214/08/

Class 1: Wednesday January 23
SUMMARY Scalars and Vectors
CURRENT READING Poole 1.1 and 1.2

## INTRO

In today's class we review the concepts of vectors and scalars. In addition, we introduce the central idea of a linear combination of vectors.

## Homework Assignment \#1

Section 1.1 \# 1d, 2d, 3c, 4c, 5a, 6, 9, 11, 15, 17, 20 : DUE FRI JAN 26
EXTRA CREDIT \#14

## 1. What is a vector?

Roughly speaking, a vector is just a "bunch of numbers"!
More precisely, a vector is an ordered set of numbers.
Example 1. $\left[\begin{array}{ll}2 & 0\end{array}\right]$ is a vector; $\left[\begin{array}{ll}0 & 2\end{array}\right]$ is also; these are two different vectors, since order matters.
$\left[\begin{array}{lll}2 & -5 & 7.1\end{array}\right]$ is a row vector; $\left[\begin{array}{c}2 \\ -5 \\ 7.1\end{array}\right]$ is a column vector.
Q: What's the difference between a row vector and a column vector?
Note. To save space, we sometimes write $(4,0,-8)$ instead of $\left[\begin{array}{c}4 \\ 0 \\ -8\end{array}\right]$. So $(4,0,-8)$ is a column vector.
Each number in the vector is called a component of the vector.
Q: What's the second component of the vector $\left[\begin{array}{ll}3 & 6\end{array}\right]$ ? Ans:

## 2. Vectors can be used to represent many different things!

Example 2. Start from home. Drive 6 miles East, 2 miles North. Represent this by the vector [6 2].
Then continue driving 3 miles East, 5 miles South. Represent this by $\left[\begin{array}{ll}3 & -5\end{array}\right]$.
Q: Where are we relative to home?
Ans: Add the two vectors: $\left[\begin{array}{ll}6 & 2\end{array}\right]+\left[\begin{array}{ll}3 & -5\end{array}\right]=\left[\begin{array}{ll}9 & -3\end{array}\right]$.

## NOTE Vectors are added component-wise: one component at a time.

Example 3. I have 4 nickels, 3 dimes, and 2 quarters. You give me 3 nickels and 1 dime, and take 1 quarter. So I'm left with: $\left[\begin{array}{lll}4 & 3 & 2\end{array}\right]+\left[\begin{array}{lll}3 & 1 & -1\end{array}\right]=\left[\begin{array}{lll}7 & 4 & 1\end{array}\right]$.

## A Note on Notation

The book uses boldface letters for vectors. It is difficult to write in boldface. So instead we'll use "arrow notation" for vectors:
Book: Let $\mathbf{v}=\left[\begin{array}{ll}4 & 3\end{array}\right]$. Let $\mathbf{w}=\left[\begin{array}{ll}5 & 3\end{array}\right]$. Then $\mathbf{v}+\mathbf{w}=$ ?
Us: Let $\vec{v}=\left[\begin{array}{ll}4 & 3\end{array}\right] . \vec{w}=\left[\begin{array}{ll}5 & 3\end{array}\right]$. Then $\vec{v}+\vec{w}=$ ?
Example 4. $\left[\begin{array}{ll}4 & 2\end{array}\right]+\left[\begin{array}{lll}3 & 1 & -1\end{array}\right]=$ ?Ans: Undefined.
NOTE Vectors of different size can NOT be added to each other.

## 3. Multiplying a vector by a number: scalars

What's $5+5+5+5+5+5=$ ?
What's $\left[\begin{array}{ll}5 & 3\end{array}\right]+\left[\begin{array}{ll}5 & 3\end{array}\right]+\left[\begin{array}{ll}5 & 3\end{array}\right]+\left[\begin{array}{ll}5 & 3\end{array}\right]+\left[\begin{array}{ll}5 & 3\end{array}\right]+\left[\begin{array}{ll}5 & 3\end{array}\right]=$ ?
So, what's $6[53]=$ ? Ans:
Here the number 6 is called a scalar. Why? Because if you draw both vectors, [ $\left.\begin{array}{ll}5 & 3\end{array}\right]$ and $\left[\begin{array}{ll}30 & 18\end{array}\right]$, on two separate $x y$-planes, they'll have different lengths but the same direction (slope): we're only changing the "scale on our map" to make one vector look like the other.

## 4. Subtracting vectors

Example 5. Let $\vec{v}=\left[\begin{array}{ll}4 & 3\end{array}\right] . \vec{w}=\left[\begin{array}{ll}5 & 3\end{array}\right]$. Then $\vec{v}-\vec{w}=$ ? Ans: $\left[\begin{array}{ll}-1 & 0\end{array}\right]$.
How can we represent vector subtraction pictorially?
Step 1. Draw $\vec{v}$.
Step 2. Multiply $\vec{w}$ by -1 .
Step 3. Add $-\vec{w}$ to $\vec{v}$.
Exercise Use the space below to draw a picture of $\vec{v}-\vec{w}$.

## 5. Linear Combinations

Example 6. Find $a$ and $b$ such that $a\left[\begin{array}{ll}5 & 3\end{array}\right]+b\left[\begin{array}{ll}3 & 2\end{array}\right]=\left[\begin{array}{ll}0 & 1\end{array}\right]$.
Ans: Solve two equations with two unknowns:
$5 a+3 b=0$
$3 a+2 b=1$.
We get: $a=-3, b=5$.
So $(-3)\left[\begin{array}{ll}5 & 3\end{array}\right]+\left(\begin{array}{ll}5\end{array}\right)\left[\begin{array}{ll}3 & 2\end{array}\right]=\left[\begin{array}{ll}0 & 1\end{array}\right]$. We say $\left[\begin{array}{ll}0 & 1\end{array}\right]$ is a linear combination of $\left[\begin{array}{ll}5 & 3\end{array}\right]$ and $\left[\begin{array}{ll}3 & 2\end{array}\right]$.
(Books sometimes just say combination, instead of linear combination.)

## DEFINITION: linear combination

Let $\overrightarrow{v_{1}}, \cdots, \overrightarrow{v_{n}}$ be vectors. To say a vector $\vec{w}$ is a linear combination of $\overrightarrow{v_{1}}, \cdots, \overrightarrow{v_{n}}$ means there exist scalars $c_{1}, \cdots, c_{n} \in \mathbb{R}$ such that $c_{1} \vec{v}_{1}+\cdots c_{n} \overrightarrow{v_{n}}=\vec{w}$. The numbers $c_{1}, \cdots, c_{n}$ are called coefficients.
Example 7. Is $\left[\begin{array}{lll}5 & 6 & 0\end{array}\right]$ a linear combination of $\left[\begin{array}{lll}1 & 0 & 0\end{array}\right]$, $\left[\begin{array}{lll}0 & 3 & 0\end{array}\right]$, and $\left[\begin{array}{lll}0 & 0 & 8\end{array}\right]$ ? Ans:
Example 8. Is $\left[\begin{array}{lll}5 & 6 & 0\end{array}\right]$ a linear combination of $\left[\begin{array}{lll}0 & 1 & 1\end{array}\right],\left[\begin{array}{lll}0 & 3 & 0\end{array}\right]$, and $\left[\begin{array}{lll}0 & 0 & 8\end{array}\right]$ ? Ans:
Example 9. What are all possible lin combs of $\left[\begin{array}{ll}1 & 0\end{array}\right]$ and $\left[\begin{array}{ll}0 & 1\end{array}\right]$ ? Ans:
Example 10. What are all possible lin combs of $\left[\begin{array}{ll}1 & 1\end{array}\right]$ and $\left[\begin{array}{ll}2 & 2\end{array}\right]$ ? Ans:
