Theorem 1 Suppose $\Psi$ and $\bar{\Delta}$ are sets and $\phi : \Psi \rightarrow \bar{\Gamma}$ is a bijection. If $\Psi = \emptyset$, then $\Delta'$ is the empty set.

1. Integration.

(a) $\int f(x) \, dx$ denotes an antiderivative of $f(x)$.

(b) $\int_0^b f(x) \, dx$ is a definite integral. Note that this can also be written as $\int_0^b f(x) \, dx$; the latter is an “inline” mathematical formula. (Look carefully at how the quotation marks are produced.)

2. Fractions, sub- and super-scripts, and square roots.

$$f(x) = \sqrt{x_{ij} - 5^{y_{ab}}}$$

3. $\lim_{x \to 0^+} \ln(x) = \infty$.

4. $\forall n \geq 0$, $\exists m > \max(2, n)$ such that $\sin^{-1}(\pi n/m) = 0$.

5. If $f : A \rightarrow B$ is one-to-one, then $a \in A \Rightarrow f(a) \in B$, and $a \neq a' \Leftrightarrow f(a) \neq f(a')$. But $\alpha < \beta \Leftrightarrow f(\alpha) < f(\beta)$.

6. Notice the different types of ellipses: $1 + 2 + \cdots + n$, vs. $1, 2, \ldots, n$.

7. $\{f_x, f_y\} = \{\partial f/\partial x, \partial f/\partial y\}$

8. $A \cup B = \{x | x \in A \lor x \in B\}$

9. (a) Here is a $2 \times 3$ matrix: $A = \begin{bmatrix} 5ab & 2 & 13 \\ 0 & -1 & 0 \end{bmatrix}$.

(b) Here is a piecewise-defined function: Let $f(x) = \begin{cases} 2x \\ \sum_{i=1}^{100} x \Delta x \end{cases}$ if $|x| \leq 2$ if $x < -2$ or $x > 2$
